

Database Design Project

Oracle Baseball League Store Database

Project Scenario:

You are a small consulting company specializing in database development. You have just been awarded the contract to develop a data model for a database application system for a small retail store called Oracle Baseball League (OBL).

The Oracle Baseball League store serves the entire surrounding community selling baseball kit. The OBL has two types of customer, there are individuals who purchase items like balls, cleats, gloves, shirts, screen printed t-shirts, and shorts. Additionally customers can represent a team when they purchase uniforms and equipment on behalf of the team.

Teams and individual customers are free to purchase any item from the inventory list, but teams get a discount on the list price depending on the number of players. When a customer places an order we record the order items for that order in our database.

OBL has a team of three sales representatives that officially only call on teams but have been known to handle individual customer complaints.

Section 2 Lesson 5 Exercise 4: Relationships

Using a Relationship Matrix (S2L5 Objective 5)

A relationship matrix shows if and how each row entity on the left side of the matrix is related to each column entity shown across the top of the matrix.

- If a row entity is related to a column entity, the name of that relationship is shown in the intersection box.
- If a row entity is not related to a column entity, the intersection box is empty.
- Recursive relationships can be represented by placing the name of that relationship on the diagonal.

Part 1:

Create a relationship matrix to validate the relationships that you have already identified throughout this project. Use the descriptions of your entities to create the names of the relationship in the intersection box.

Part 2:

Use the names that you added to the intersection boxes of the relationship matrix add the correct labels to the appropriate relationships of your ERDs.
