

Database Design Project

Oracle Baseball League Store Database

Project Scenario:

You are a small consulting company specializing in database development. You have just been awarded the contract to develop a data model for a database application system for a small retail store called Oracle Baseball League (OBL).

The Oracle Baseball League store serves the entire surrounding community selling baseball kit. The OBL has two types of customer, there are individuals who purchase items like balls, cleats, gloves, shirts, screen printed t-shirts, and shorts. Additionally customers can represent a team when they purchase uniforms and equipment on behalf of the team.

Teams and individual customers are free to purchase any item from the inventory list, but teams get a discount on the list price depending on the number of players. When a customer places an order we record the order items for that order in our database.

OBL has a team of three sales representatives that officially only call on teams but have been known to handle individual customer complaints.

Section 2 Lesson 6 Exercise : Entity Relationship Modeling (S2L6 Objective 5)

An Entity Relationship Diagram (ERD) allows you to graphical represent the system information and has the following four goals:

- Capture all required information.
- Ensure that information appears only once.
- Model no information that is derivable from other information that is already modeled.
- Locate information in a predictable, logical place.

As you have already Identified the entities, their attributes and the relationships between the entities you can now begin to construct the finalised ERD that will show how the system is linked together.

Using the information you have already gathered throughout this project construct an ERD that adheres to the four goals specified above. Construct your ERD following diagramming convention.
