

Database Design Project

Oracle Baseball League Store Database

Project Scenario:

You are a small consulting company specializing in database development. You have just been awarded the contract to develop a data model for a database application system for a small retail store called Oracle Baseball League (OBL).

The Oracle Baseball League store serves the entire surrounding community selling baseball kit. The OBL has two types of customer, there are individuals who purchase items like balls, cleats, gloves, shirts, screen printed t-shirts, and shorts. Additionally customers can represent a team when they purchase uniforms and equipment on behalf of the team.

Teams and individual customers are free to purchase any item from the inventory list, but teams get a discount on the list price depending on the number of players. When a customer places an order we record the order items for that order in our database.

OBL has a team of three sales representatives that officially only call on teams but have been known to handle individual customer complaints.

Section 3 Lesson 1 Exercise 3: More with Relationships

Identify and Draw Supertype and Subtype Entities (S3L1 Objective 4)

This exercise uses the additional scenario and meeting transcript that was provided in previous exercises.

Subtype/supertypes allow you to represent entities that have common attributes as a group.

- Each subtype is a specialization of a supertype and therefore must be enclosed within an entity.
- The common attributes and relationships for all subtypes must be listed only in the supertype, but they are inherited in every subtype.
- A subtype can and would generally have attributes and relationships of its own.
- There can never be just one subtype; another subtype should be created to contain the rest.

Using the given scenario draw any supertype and subtype groups that have been identified on your ERD.
