

Database Design Project

Oracle Baseball League Store Database

Project Scenario:

You are a small consulting company specializing in database development. You have just been awarded the contract to develop a data model for a database application system for a small retail store called Oracle Baseball League (OBL).

The Oracle Baseball League store serves the entire surrounding community selling baseball kit. The OBL has two types of customer, there are individuals who purchase items like balls, cleats, gloves, shirts, screen printed t-shirts, and shorts. Additionally customers can represent a team when they purchase uniforms and equipment on behalf of the team.

Teams and individual customers are free to purchase any item from the inventory list, but teams get a discount on the list price depending on the number of players. When a customer places an order we record the order items for that order in our database.

OBL has a team of three sales representatives that officially only call on teams but have been known to handle individual customer complaints.

Section 3 Lesson 3 Exercise 2: Normalization and Business Rules

Using Normalization to Validate Data (S3L3 Objective 3)

First Normal Form

Normalization is a relational database concept, but its principles apply to data modeling.

- First Normal Form (1NF)
 - The data is atomic (All attributes must be single-valued).
 - The entries in a column are of the same type.
 - There can be no duplicated rows in the table meaning that the table has a group of columns that uniquely identifies the row.

Take the un-normalized data that is currently represented in the ERD and apply the principles of First Normal Form so that the data can be said to be in 1NF.
