

Database Foundations

6-6 : Retrieving Data Practices

Exercise 1: Retrieving Columns from tables

Overview

In this practice you will perform the following tasks on the tables created for the Academic Database:

- Select all the columns from a table
- Select specific columns from a table

Tasks

1. Write a simple query to view the data inserted in the tables created for the academic database
2. Write a query to retrieve the exam grade obtained by each student for every exam attempted.
3. Write a query to check if a student is eligible to take exams based on the number of days he/she attended classes.
4. Display the LOGIN_DATE_TIME for each faculty member.
5. Display the name of the Head of the Department for each of the Departments.
6. Retrieve the student ID and first name for each student concatenated with literal text to look like this:
720: FIRST NAME IS JACK
7. Display all the distinct exam types from the AD_EXAMS table.
