

2 CAREERS IN IT

IT professionals can find employment in many different fields. They can work as technicians, developers, programmers, hardware engineers, admins, analysts, SW test engineers, and other positions. The most important IT fields include technical support, administration, development and SW testing.

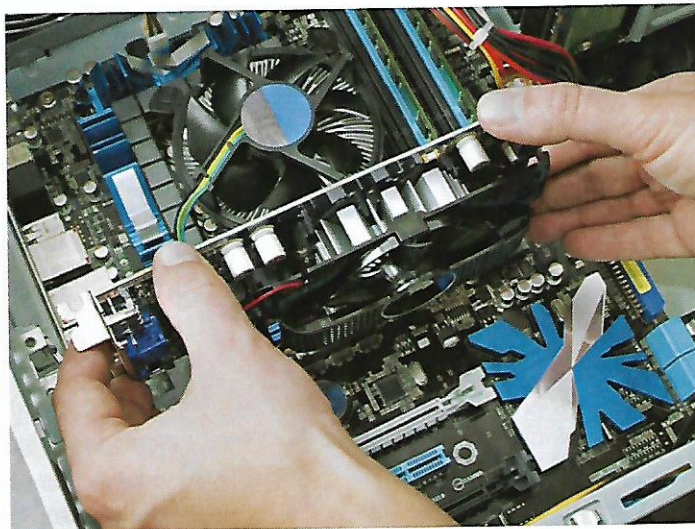

Technician jobs include help desk technicians, service desk specialists, bench technicians or remote technicians and require skills such as building computers (computer assembly), upgrading, performing installations, performing preventive maintenance, troubleshooting and repairing computers.

Administrators deal with managing and maintaining, e.g. database, network, system admins, Windows admins, Unix/Linux admins, etc.

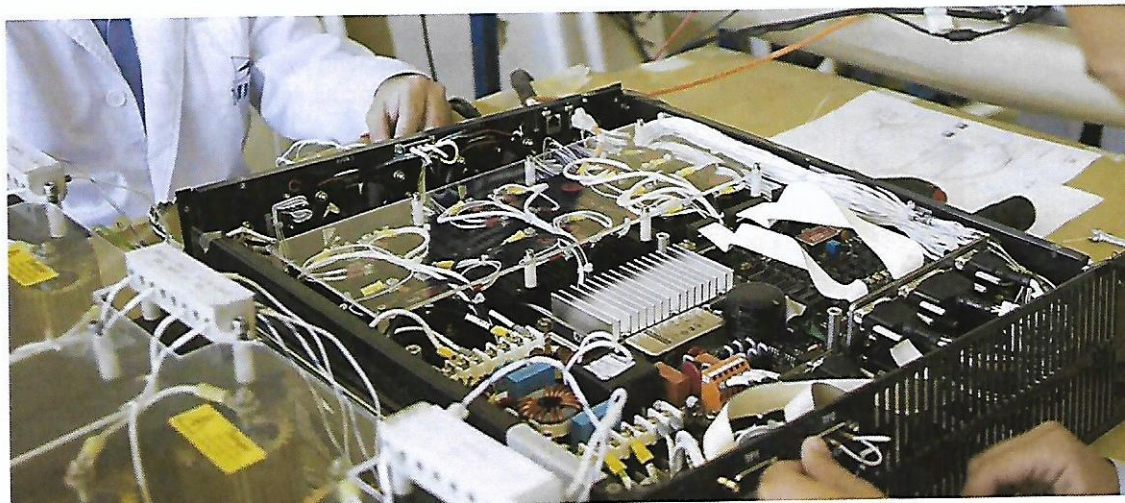

Development includes professions in software engineering, software development, programming, computer hardware engineering, web development and web design. Software engineers research, design, develop and maintain a software project, while developers are concerned with a development process itself, and programmers with coding. Hardware engineers design and develop computer components and devices.
